Bouwkamp, Meixner, Maue, Jones and others have discussed the character of the singularities and the restrictions which must be imposed on them to insure uniqueness and physical significance, in the case of locally wedge-shaped conductors in homogeneous media. The purpose of the present work is to investigate the effect of a discontinuity of medium on the singularity. The investigation is confined to the electrostatic case, but it is hoped that the information obtained may prove of some value also in the electromagnetic case, since both cases usually present similar behavior at singularities. In addition, the electrostatic results obtained may be of some intrinsic interest. Some of these results are independent of the form of the conductor. This investigation originated in an attempt to explain the phenomena which occur under certain conditions when irises in waveguides are covered with transparent plastics. It is observed that the plastic tends to become charred and pitted in the neighborhood of the edges of the screen. Since this phenomenon could be ascribed to the high field strength at an edge, it seemed to be of interest to determine how and whether the singularity of the field differs from that occurring when the aperture is left open. We proceed to outline the course of the investigation. In Section 2 we study the behavior of the singular part of the electrostatic solution in the neighborhood of the edge of a wedge-shaped conductor in the presence of two media with two...
